

Parses content and returns parser output.

See the various prop-modules of **action=query** to get information from the current version of a page.

There are several ways to specify the text to parse:

1. Specify a page or revision, using *\$1page*, *\$1pageid*, or *\$1oldid*.
2. Specify content explicitly, using *\$1text*, *\$1title*, and *\$1contentmodel*.
3. Specify only a summary to parse. *\$1prop* should be given an empty value.
